                                                                                                                                                                                                                                                                                                                           Note-No experimental confirmation available;
--- TISSUE SPECIFICITY: Expressed in endothelial cells, cultured fibroblasts and osteoaarcoma, but not in platelets, leukocytes, monocytic cell lines or peripherical blood cells.
--- INDUCTION: Activated by lysophosphatidylcholine (lysoPC).
--- DOMAIN: Polybasic regions located between residues 265 and 556 are involved in binding PKC.
--- DISEASE: ANTIBOLIES TO THE C-TERMINAL OF GRAVIN CAN BE PRODUCED BY PATIENTS WITH MYASTHENIA GRAVIS (MG).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        between the Swiss Institute of Bioinformatics and the EMBL outstatistic the Buropean Bioinformatics Institute. -!- FUNCTION: THIS IE PROTEIN IS A MULTIFUNCTIONAL PROTEIN CAPABLE OF MIGHATING TO THE NUCLEUS, BINDING TO DNA, TRANS-ACTIVATING OTHER VIRAL GENES, AND AUTOREGULATING ITS OWN SYNTHESIS.
-!- SUBCELLULAR LOCATION: Nucleus of infected cells.
-!- PTW: A long stretch of serine residues may be a major site of phosphorylation.
-!- SIMILARITY: BELONGS TO THE ICP4/IE140/IE180 FAMILY.

-1-SUBUNIT: There are six type IV collagen isoforms, alpha 1(IV)-
alpha 6(IV), each of which can form a triple helix structure
with 2 other chains to generate type IV collagen network.

-1-DOMAIN: Alpha chains of type IV collagen have a noncollagenous
domain (NCI) at their C-terminus, frequent interruptions of the
G-X-Y repeats in the long central triple-helical domain (which may
cause flexibility in the triple helix), and a short N-terminal
triple-helical 7S domain.

-1-PTM: Lysines at the third position of the tripeptide repeating
unit (G-X-Y) are hydroxylated in all cases and bind carbohydrates.

-1-PTM: Prolines at the third position of the tripeptide repeating
unit (G-X-Y) are hydroxylated in some or all of the chains.

-1-PTM: Type IV collagens contain numerous cysteine residues which
are involved in inter- and intramolecular disulfide bonding. 12 of
these, located in the NCI domain, are conserved in all known type
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           This SWISS-PROT entry is copyright. (Cell Biology.") Agris 73-1582 (1996).

-!- FUNCTION: May play an important role in fibrillogenesis by controlling lateral growth of collagen II fibrils (By similarity).

-!- SUBUNIT: Trimers composed of three different chains: alpha 1(XI), alpha 2(XI), and alpha 3(XI). Alpha 3(XI) is a post-translational modification of alpha 1(II). Alpha 1(V) can also be found instead of alpha 3(XI)=1(II) (By similarity).
                                                                                                                                                                                                                                                                                                                                                             Vandenberg P., Vuoristo M.M., Ala-Kokko L., Prockop D.J.;

"Drosophila genes Posterior Sex Combs and Suppressor two of zeste encode proteins with homology to the murine bmi-1 oncogene.";

Nature 353:351-353(1991).

-I. FUNCTION: The Polycomb group (Pc-G) genes are needed to maintain expression patterns of the homeotic selector genes of the antennapedia (Antp.C) and bithorax (Bx-C) complexes, and hence for the maintenance of segmental determination.

-I. SUBCELLULAR LOCATION: Nuclear (Probable).

-I. SIMILARITY: Contains 1 RING-type zinc finger.
                                                                                                                                                                                                                                                                                                   1124 AISQGMSVQLHVPYSEHAKAPVGPVTMGLPLPMDPKKLAPFSGVKQEQLSPRGQAGPPES

nidogen.

-!- SUBNIT: There are six type IV collagen isoforms, alpha 1(IV)-
alpha 6(IV), each of which can form a triple helix structure
alpha 6(IV), each of which can form a triple helix structure
with 2 other chains to generate type IV collagen network.
C -!- DOWAIN: Alpha chains of type IV collagen have a noncollagenous
domain (NCI) at their C-terminus, frequent interruptions of the
G-X-Y repeats in the long central triple-helical domain (which may
criple-helical TS domain.
C triple-helical TS domain.
C triple-helical TS domain.
C -!- PTM: Prolines at the third position of the tripeptide repeating
unit (G-X-Y) are hydroxylated in some or all of the chains.
C -!- PTM: Type IV collagens contain numerous cysteine residues which
are involved in inter- and intramolecular disulfide bonding. 12 of
these, located in the NCI domain, are conserved in all known type

                                                                                                                                                                                       PTM: Phosphorylation seems to play a major role in the functioning of the larger neurofilament polypeptides (NF-M and NF-H), the levels of phosphorylation being altered developmentally and coincident with a change in the neurofilament function.

SIMILARITY: Belongs to the intermediate filament family.
CAUTION: Ref. 2 sequence differs from that shown in positions 534 to 716 and is shorter due to frameshifts.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 l coil; Neurone; Phosphorylation; Repeat.
